These instructions explain how to use the SPI Fx units and show their various configurations. The SPI Fx is used to forward the same zone, usually in the case of an obstacle or the need to extend the distance covered.

The SPI Fx is connected to a SPI Tx which transmits to an Rx or another Fx unit. The SPI Fx receives the signal it needs to forward from either a Tx or an Sx unit. The SPI FX unit may be connected to 12V or to the SPI bus.
